

HYDROSEEDING

TAILORED HYDROSEED SOLUTIONS

STABILISE
BARE AREAS

SINCE

1975

Hydroseeding (or hydro-mulching) is a planting process which utilises a slurry of seed and mulch. The slurry is transported in a tank, either truck- or trailer-mounted and sprayed over the ground in a uniform layer. Erosion Control have developed an extensive range of products that can be tailored specific to each site's unique requirements.

GOLF COURSE CONSTRUCTION

Over the years Erosion Control have forged a close relationship with New Zealand's leading course designers and have developed a range of hydroseeding solutions specifically to meet the demands of establishing fairways, tees and around the greens.

ESTABLISH
LONG TERM
VEGETATION

SINCE

1975

ROADSIDE HYDROSEEDING

Whether as a result of road re-alignment, new construction or slip repair, hydroseeding is the most efficient, practical and cost effective way to quickly establish vegetation over an area. With a fleet of specialist equipment, one hydroseeding unit can cover around 10,000 sqm per day. With our truck mounted Hydrocanon we can spray 45m high and over 100 from the truck with a range of hoses. Whether the long term goal is to re establish native vegetation or long term grass cover, Erosion Control will supply a mix of hydromulch, seed and fertilizer best suited to the local environment.

LIQUID SOIL™

Erosion Control's Liquid Soil™ is our premium hydroseeding product, engineered for areas with poor quality soils, to optimise vegetation establishment and longevity. Our unique combination of organic hydromulch, composts, fertilizer and tackifier ensures we consistently outperform all other hydroseeding applications.

PROTECTION
AGAINST THE
FORCES OF
EROSION

SINCE

1975

HYDROHAY™

Hydrohay™ offers additional stabilisation where it is needed most. Our unique formula of hydromulch and sterile hay fibers forms a protective barrier by providing superior moisture retention through dryer periods and insulation from frosts in colder times, resulting in a faster germination and establishment. Hydrohay™ is the ideal solution for swale drain, around culvert and berm areas.

RESEARCH & DEVELOPMENT

We continually strive to be a global innovator in our field. Whilst being mindful of overseas products and developments, our in house R&D programme is focussed on local innovation for local solutions. Our purpose built technology continues to out perform expensive imported hydromulch products and wood fibres. As well as maintaining our philosophy of recycling where possible, recycled newsprint also supplies funding to our local suppliers such as schools and charitable organisations.
